AI-Powered Sales Business Intelligence Dashboard

Automated Data Summarization and Report Generation using Power BI, Python & AI Chatbot

Super Store

Information

This project presents an AI-Driven Sales Performance Dashboard developed using Power BI and Python.
It integrates interactive visualizations with automated data summarization techniques.
An AI chatbot enables natural language interaction for business queries.

Executive Overview

This page provides a high-level summary of overall business performance.
It displays key KPIs such as total sales, profit, margin, orders, and customers.
Regional and category performance trends are visualized dynamically.
The goal is to quickly assess overall business health and growth.

Sales Analytics

This section presents detailed analysis of product and category-level sales performance.
It includes monthly and yearly trend analysis with drill-down capabilities.
Customer segments and regional comparisons are highlighted.
The page helps identify revenue drivers and performance patterns.

Risk & Performance

This page focuses on identifying potential risks and performance gaps.
It highlights low-margin products, declining sales trends, and regional weaknesses.
Discount impact and profitability variations are analyzed.
The objective is to support proactive business improvement strategies.

AI Insights

This page integrates Python-based analytics and AI-driven logic.
It performs KPI generation, anomaly detection, and predictive forecasting.
The chatbot provides automated responses to business-related queries.
Intelligent insights assist management in strategic decision making.
